

Greendale's Allergy Programme

We at Greendale are the sole provider of one of the USA's most widely used veterinary allergy testing and kit suppliers. In fact, over 250,000 dogs, cats and horses have been tested utilizing this programme.

Unlike most of the other allergy testing laboratories, this provider dedicates its research **entirely** on the veterinary field, and therefore are not carrying out 'offshoot' testing from the human sector.

Together with our supplier we are continually looking to improve and upgrade our services and as a result have introduced important changes, for example, not mixing mould antigens with pollens in the immunotherapy.

So why should you use Greendale's Allergy testing?

Our dedicated veterinary allergy testing provides advantages of having, a large portfolio of allergens, separate formulations for small dogs and cats. There is also no need to withdraw steroids prior to testing and no aluminum hydroxide adjuvant is added to treatment sets, therefore reducing the risk of irritation.

Our current clients' feedback

A survey of patients on immunotherapy treatment revealed the following:

Response	Equine	Canine and Feline
Very Good	40%	17%
Good	47%	60%
Acceptable	6%	14%
Variable	7%	9%

These results are very positive and encouraging. In addition, many practitioners mentioned the ease of use of immunotherapy.

Summary

So in summary, our allergy testing offers a dedicated veterinary service, with a huge number of advantages over other providers and as more allergens are measured it also offers great value for money and therefore savings for veterinary costs.
